KaziOS

BUSINESS OPERATING SYSTEM

The AI-native operating system for African businesses

Project presentation · Mathew Kioko · mathewtech200@gmail.com

github.com/MathewTech254/KaziOs

THE PROBLEM

Ten tools, ten versions of the truth

POS | Inventory | Customers | Purchasing | Invoicing

Payments | Expenses | Accounting | Reporting | BI

Stock drifts

The sale updates the till, not the shelf.

Double entry

The same sale gets re-typed into three systems.

Invisible balances

Who owes what lives in a notebook at the counter.

Late decisions

Reports arrive after the decision was due.

WHY EXISTING SOFTWARE FAILS HERE

Built for a different market

Mobile money first

M-PESA is how most customers actually pay. Global tools treat it as an afterthought — or ignore it entirely.

Multi-branch by default

SMEs grow into branches, warehouses and agents. The software must model that shape from day one.

Connectivity comes and goes

Work must keep flowing on unreliable networks — offline tolerance cannot be a future luxury.

Pricing that fits the market

Foreign-currency enterprise pricing does not scale with an African SME. Plans must grow with the business.

THE SOLUTION

One transaction — everything connected

When a sale happens, payment, stock, customer history, books and reporting update together — automatically.

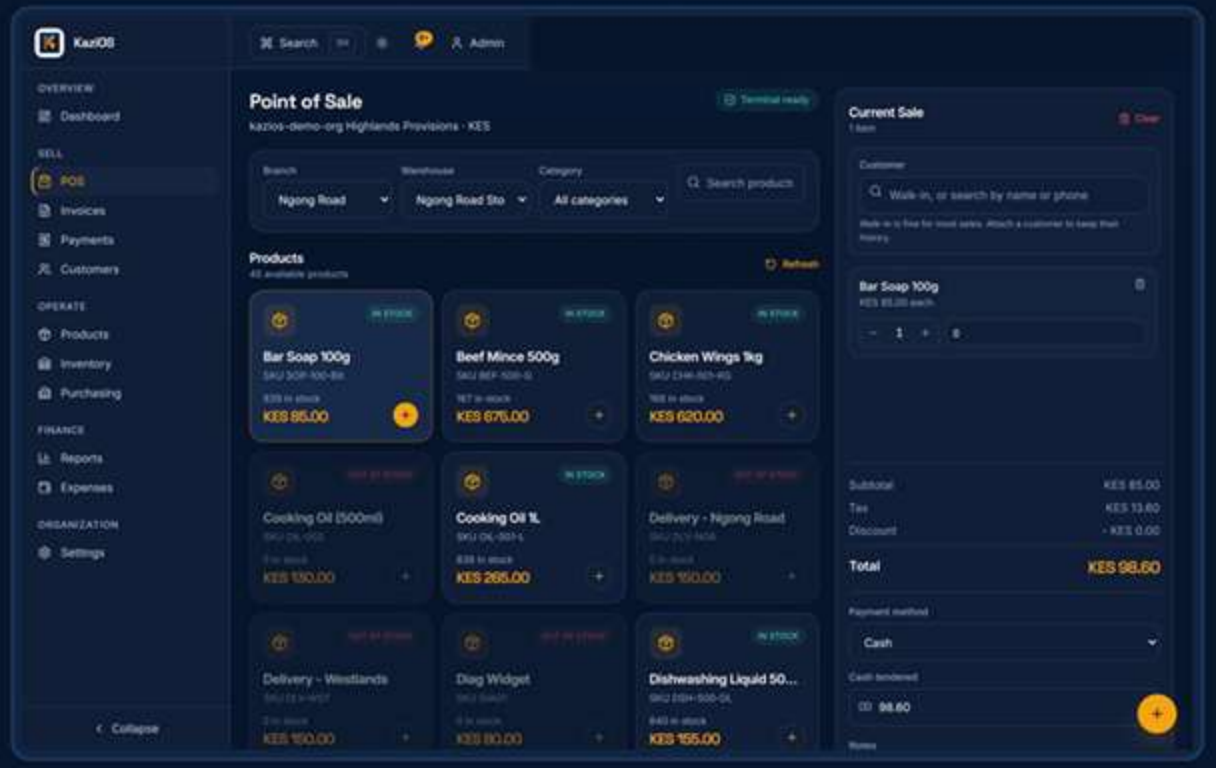

"A business transaction should not exist in isolation."

— KaziOS design principle

THE PLATFORM

Everything a business runs on, in one system

Core modules are live today — the deeper workflows are in active build.

Live POS — branch, warehouse and category filters in one screen.

Point of Sale

Search, cart, discounts, tax, receipts and cashier workflows.

Products & Inventory

SKUs, barcodes, categories, warehouses and stock movements.

Customers

Profiles, history, outstanding balances and returns.

Sales & Invoicing

Invoices, line items, partial payments and statuses.

Purchasing

Supplier → purchase order → receiving → stock → balance.

Payments

Card (Paystack) and M-PESA rails, refunds and tracking.

Reporting

Sales, stock, customer and financial reports.

AI Insights

Business intelligence grounded in your own numbers.

Multi-branch · Warehouses · Roles & permissions · Audit logging · Notifications · Settings

FLAGSHIP INTEGRATION

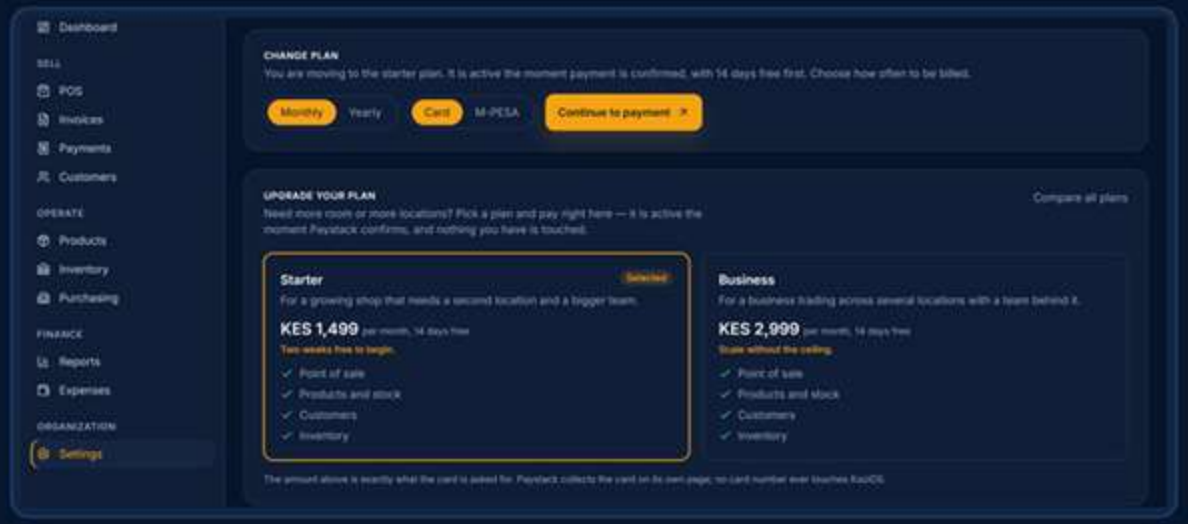

Billing that works the way Africa pays

Paystack — cards

Card checkout with webhook-verified confirmation and idempotent activation — a payment can never be granted twice.

M-PESA — Safaricom Daraja STK Push

The customer approves on their own phone with their PIN. The server then re-queries Safaricom to verify — the callback can only trigger a check, never grant access.

Why it is trustworthy

- Amount checked against the plan price — every time
- Idempotent activation: one payment, one grant, ever
- Unsigned webhook can only trigger a verification query
- Rate-limit aware: undecided payments poll politely, then retry

Both rails share one subscription engine — same plans, same limits, same billing portal.

BUSINESS MODEL

Freemium SaaS — paid where Africa pays

Free plan

Start free with core features and sensible limits. The door stays wide open.

Paid plans

More capacity and features. Monthly or annual billing, cancelled any time.

Grows with you

Direction: as a business adds branches and teams, its tier grows with it.

Why the model works here

- Local payment methods (M-PESA) lift conversion where cards are rare
- Entitlements are enforced server-side — limits stay honest, clients cannot spoof them
- Annual billing rewards commitment and smooths cash flow

MARKET & USERS

Kenya first — built for African markets

Who uses KaziOS

The owner

Cash visibility across every branch, in real time.

The cashier

A fast checkout: few clicks, receipts, less training.

The store manager

Stock truth — what moved, what is low, what was ordered.

The accountant

Clean books: invoices, payments and customer balances.

Where we start

- SME retailers & wholesalers in Kenya — shops, hardware, groceries, pharmacies, distributors
- Multi-branch businesses that outgrew spreadsheets and single-purpose apps
- Expansion path across Africa as payment rails and tax integrations land

Why now

- Digital payments are becoming the default
- Tax authorities are digitising invoicing
- Owners demand one source of truth

WHERE WE ARE

Shipping in public

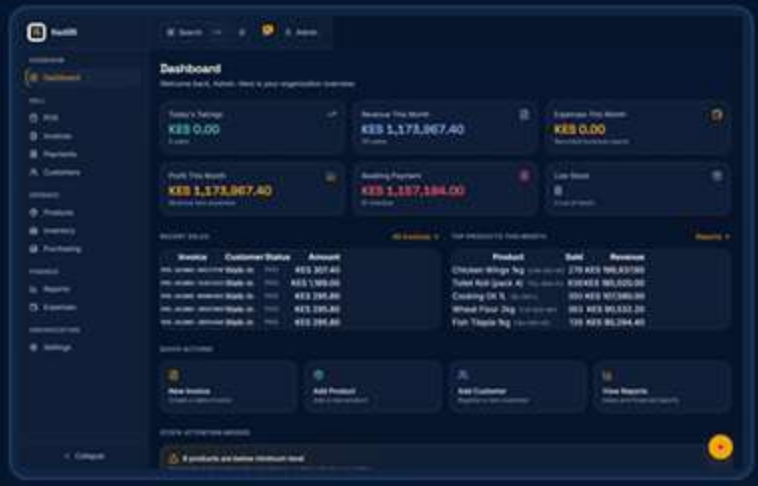

190+ passing tests | **Typecheck + lint gates** | **Public GitHub repo** | **Production deployed**

LIVE TODAY

- Authentication, organizations, roles & audit logging
- Products, customers, invoices, payments
- Branches, warehouses, settings, notifications
- POS foundation and reporting foundation
- Subscription plans, free tier, feature entitlements
- Paystack + M-PESA payment rails, billing portal
- Docs: architecture, subscriptions, M-PESA walkthrough

IN ACTIVE BUILD

- Complete cashier workflow & barcode scanning
- Returns, refunds, split payments, cashier shifts
- Inventory ledger, transfers & stocktaking
- Purchasing lifecycle & supplier balances
- Accounting core (GL, receivables/payables, P&L)
- AI business copilot across every module
- Offline POS · KRA eTIMS · WhatsApp & SMS

In production today

The live dashboard — real organisation data: KES 1.17M revenue this month, 151 sales, low-stock alerts and top products.

TECHNOLOGY

Modern, typed, tested

WEB

- React 18 + TypeScript
- Vite build + Tailwind CSS
- TanStack Router & Query
- Radix UI · Recharts charts
- Jest + Testing Library

API

- Node.js + Express
- Zod request validation
- JWT sessions + argon2
- Rate limiting + Helmet
- BullMQ background jobs

DATA & INFRA

- PostgreSQL (Neon)
- Prisma ORM + migrations
- Redis sessions & cache
- Monorepo: 6 shared packages
- Cloud deployment (Render)

Quality gates: typecheck · lint · 190+ unit tests · integration suite **Security:** RBAC · audit trail · hashed secrets · HTTPS-only callbacks

ROADMAP

Now → Next → Later

NOW

Live in production

- Core platform & multi-branch ops
- Paystack + M-PESA payment rails
- Free & paid subscription tiers
- Documentation & test suite

NEXT

The deep workflows

- Complete cashier workflow & shifts
- Inventory ledger, transfers, stocktaking
- Purchasing lifecycle & suppliers
- Accounting core (GL, AR/AP, P&L)

LATER

Intelligence & scale

- AI business copilot
- Offline POS for intermittent networks
- KRA eTIMS compliance integration
- WhatsApp/SMS & pan-African expansion

WHY KAZIOS

Local by design — serious under the hood

Built here, not adapted

Mobile money, multi-branch reality and Kenyan compliance are the default path — not future tickets on a foreign roadmap.

Connected data model

One sale updates six systems. No reconciliation tax, no drift between the till, the shelf and the books.

Engineering you can audit

Public repo, typed codebase, 190+ tests, and written docs for every payment rail — including the M-PESA walkthrough.

Founder on the ground

Mathew Kioko — building in Kenya, shipping in public, iterating toward what African businesses actually need.

Run your whole business on one system.

Thank you

KaziOS — the AI-native operating system for African businesses
